

## **FOR DISBELIEVERS OR BEGINNERS**

### **A DOWSING EXPERIMENT**

**Peter Morrin**

Do you know a friend or of someone who you have met when using the pendulum who is not quite convinced that you are not fooling yourself, as you are mystifying them?

You will no doubt have gone to some trouble to explain various aspects of the act. Even let them try it for themselves. If they have some questions they particularly want answered and after explaining to them how to pose a question which in itself can be the biggest cause of failure in the early stages, let them try again for themselves.

If they have difficulty try this method. Tell them to get their questions thought out and allow you to tune your pendulum and yourself and then into them. At this stage tell them you are ready and that they can ask the first question MENTALLY while you tune into their mental question. Sure enough you will get the answer with the pendulum as if you had asked it yourself for them or indeed as if they had had sufficient practice to do it for themselves.

I have used this method many times and in fact prefer it as a dowsing method. I do not get involved with a lot of backwards and forwards talk, yet at the same time I can comment on the answer as to quality of question and depth of response. I can even tell them if the question has previously been asked by them (yes – the response is much weaker the second time round so learn to rely on the immediate first response) and even if the question is properly or poorly put, or improper, when no visible response for them comes through. The response is felt in the fingers however, and a warning given.

It can be quite surprising when this is done in a small group as each person realises in turn how difficult it is to ask satisfactory questions especially in series. We all have difficulty at times do we not, keeping up a series of questions when each new one is based on a previous answer.

You will find after the first few attempts that people quickly pick the pattern of questions that get them the best responses and this can help them quite markedly with their own dowsing responses.

The interesting thing for me is that I seem to be more aware of the depth of subject matter and quality of question and the visible response tends to be noticeably more varied which also helps to express the answer for the querent.

I have also found this method of help when I do not want to get personally involved with the subject on which advice is requested.

The process too is very much quicker than verbally getting question and giving answer. Surprisingly so, as the answer can be coming through at the same time as the question is being formed in their minds. By commenting on the apparent weight

and twitch or general response of the pendulum yourself as the answers come through the quirent has even more incentive to get down to practice for themselves.
